1 Package *pycosmicstar*

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

1.1 Modules

- **cosmicstarformation** (*Section 2, p. 3*)
- **cosmolib** (*Section 3, p. 6*)
 - **lcdmlib**: This module 'lcdmlib' is auto-generated with f2py (version:2). (*Section 4, p. 7*)
- **cosmology** (*Section 5, p. 9*)
- **csfrfromfit** (*Section 6, p. 12*)
- **diferencial** (*Section 7, p. 13*)
- **filedict**: filedict.py a Persistent Dictionary in Python (*Section 8, p. 15*)
- **filedict_old**: filedict.py a Persistent Dictionary in Python (*Section 9, p. 17*)
- **lcdmcosmology** (*Section 10, p. 20*)
- **observationalCSFR** (*Section 11, p. 26*)
- **parallellistcompreension** (*Section 12, p. 28*)
- **paralleloverlist** (*Section 13, p. 29*)
- **pylcdmlib** (*Section 14, p. 31*)
- **run_kut4** (*Section 15, p. 32*)
- **structures** (*Section 16, p. 34*)
- **structuresabstract** (*Section 17, p. 39*)
- **test_all** (*Section 18, p. 41*)
- **test_cosmology** (*Section 19, p. 42*)

2 Module *pycosmicstar.cosmicstarformation*

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

2.2 Class *cosmicstarformation*

The Cosmic Star Formation rate

The model used to develop this class was presented by the first time in the article of Pereira and Miranda (2010) - (MNRAS, 401, 1924, 2010).

The cosmologic background model is passed as a instance parameter:
cosmology

Keyword arguments:

`tau` -- (default - 2.5) time scale, in Gyr, of the CSFR.

`eimf` -- (default 1.35) exponent of the Initial Mass Function

`nsch` -- (default 1) the normalization factor in the CSFR model

`imfType` -- (default S - Salpeter) the Initial Mass Function Type.
Possible values:
S: Salpeter
K: Kroupa

`lmin` -- (default 6.0) log10 of the minal mass of the dark halo
where it is possible to have star formation.

`zmax` -- (default 20.0) - the maximum redshift to be considered

`omegam` -- (default 0.24) - The dark matter parameter

`omegab` -- (default 0.04) - The barionic parameter

`omegal` -- (default 0.73) - The dark energy parameter

`h` -- (default 0.7) - The h of the Hubble constant ($H = h * 100$)

`massFunctionType` -- (default "ST") The type of mass
function of dark matter halos used. Possibles values:
"ST" for Seth and Thormen mass function.
"TK" for Tinker et al. mass function.

2.2.1 Methods

`__init__(self, cosmology, tau=2.29, eimf=1.35, nsch=1, lmin=6.0, zmax=20.0, imfType='S', **kwargs)`

Overrides: `pycosmicstar.structures.structures.__init__`

`getIMFDict(self)`

Return a list with keys and functions of IMF's

`putIMFDict(self, key, value)`

Put a new term in the imf Dictionary

`remnant(self, m)`

Return the remnant mass of the object after the colapse of the star with mass m

phi (<i>self</i> , <i>m</i>)

Return the Initial Mass Function

cosmicStarFormationRate (<i>self</i> , <i>z</i>)

Return the Cosmic Star Formation rate as a function of <i>z</i>

Overrides: <code>pycosmicstar.structuresabstract.structuresabstract.cosmicStarFormationRate</code>
--

gasDensityInStructures (<i>self</i> , <i>z</i>)
--

Return the barionic gas density into structures

Overrides: <code>pycosmicstar.structuresabstract.structuresabstract.gasDensityInStructures</code>

Inherited from `pycosmicstar.structures.structures`(Section 16.2)

`abt()`, `fbstruc()`, `fstm()`, `getCacheDir()`, `getDeltaHTinker()`, `getmassFunctionDict()`, `halos_n()`, `massFunction()`, `numerical_density_halos()`, `setDeltaHTinker()`, `setMassFunctionDict()`, `setQBurrFunction()`

3 Package pycosmicstar.cosmolib

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

3.1 Modules

- **lcdmlib:** This module 'lcdmlib' is auto-generated with f2py (version:2).
(*Section 4, p. 7*)

4 Module *pycosmicstar.cosmolib.lcdmlib*

This module 'lcdmlib' is auto-generated with f2py (version:2).

Functions:

```

about()
init(omegab1,omegam1,omegal1,h1)
dtdz = dtdz(z)
rz = rz(z)
g = g(z)
dr_dz = dr_dz(z)
dv_dz = dv_dz(z)
age = age(z)
km,sg = sigma(anorm,alfa1,beta1,gama1,ct2,kmass)
dsigma2_dk = dsigma2_dk(k1)
grow = grow(z)
rhodmz = rhodm(rhodm0,z)
rhobrz = rhobr(rhob0,z)
yarray = rk4_int(fun,y,harray,xarray,fun_extra_args=())
res = romberg(func,a,b,tol,func_extra_args=())
r = richardson(r,k)
lnew = trapezoid(func,a,b,iold,k,func_extra_args=())
jl = locate(xx,x)
dfridr = dfridr(func,x,h,err,func_extra_args=())

```

COMMON blocks:

```

/cparam/ omegab,omegam,omegal,h
/dados/  escala,alfa,beta,gama

```

<code>__package__</code>	Value: None

5.2 Class cosmology

Known Subclasses: pycosmicstar.lcdmcosmology.lcdmcosmology

5.2.1 Methods

dt_dz(*self*, *z*)

Return the relation between the cosmic time and the redshift

dr_dz(*self*, *z*)

Return the comove-radii

dV_dz(*self*, *z*)

Return the comove volume

rodm(*self*, *z*)

Return the Dark Matter Density

robr(*self*, *z*)

Return the Barionic Matter Density

H(*self*, *z*)

Return the Hubble Parameter

dgrowth_dt(*self*, *z*)

Return the derivative of growth function of the primordial perturbations

growthFunction(*self*, *z*)

Return the growth function of the primordial perturbations

dsigma2_dk(*self*, *kl*)"Return the integrating of $\sigma(M,z)$ for a top-hat filtering. In $z = 0$ return σ_{-8} , for $z > 0$ return $\sigma(M,z)$ **sigma**(*self*)

Return the variance of the linear density field. As pointed out by Jenkis et al. (2001), this definition of the mass function has the advantage that it does not explicitly depend on redshift, power spectrum or cosmology.

age(*self*, *z*)Return the age of the Universe for a given *z*

setCosmologicalParameter(*self*)

getCosmologicalParameter(*self*)

getTilt(*self*)

getRobr0(*self*)

getRodm0(*self*)

6 Module *pycosmicstar.csfrfromfit*

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

6.1 Functions

rho_starF(z , h)

Return CSFR by the work of Fardal et al. (MNRAS, 379,985,2007) MNRAS, 339,312,2003.

rho_starHB(z , h)

Return CSFR by the work of Hopkins e Beacom, Apj, 651, 142, 2006.

rho_starSH(z)

Return CSFR by the work of Volker, Springel, Lars and Hernquist MNRAS, 339,312,2003.

6.2 Variables

7 Module *pycosmicstar.diferencial*

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

7.1 Functions

locate(*xx, n, x*)

Localiza a posicao de dado ponto a partir de dois adjacentes.

argumentos: *func* — funcao ou tabela de entrada *xx* — tabela de entrada *n* — numero de pontos da tabela *x* — valor de *x* que se deseja determinar *y* *j* — posicao de saida

dfridr(*func, x, h, err*)

Fornece a derivada de *y* em relacao a *x*.

argumentos: *func* --- funcao a ser integrada
x --- dlog10 *m* ou *z*
h --- passo para a diferenciacao
err --- parametro interno de erro da function

8 Module pycosmicstar.filedict

filedict.py a Persistent Dictionary in Python

Author: Erez Shinan Date : 31-May-2009

8.1 Class Solutions

8.1.1 Class Variables

Name	Description
Sqlite3	Value: 0

8.2 Class FileDict

collections.UserDict —
pycosmicstar.filedict.FileDict

A dictionary that stores its data persistantly in a file

Options:

filename - which file to use

connection - use an existing connection instead of a filename (overrides filename)

table - which table name to use for storing data (default: 'dict')

8.2.1 Methods

```
__init__(self, filename=None, solution=Solutions.Sqlite3, **options)
```

```
__getitem__(self, key)
```

```
__setitem__(self, key, value)
```

```
__delitem__(self, key)
```

```
update(self, d)
```

```
__iter__(self)
```

keys(*self*)**values**(*self*)**items**(*self*)**__contains__**(*self*, *key*)**__len__**(*self*)**__del__**(*self*)**batch**(*self*)

9 Module pycosmicstar.filedict__old

filedict.py a Persistent Dictionary in Python

Author: Erez Shinan Date : 24-May-2009

9.1 Variables

Name	Description
<code>__package__</code>	Value: 'pycosmicstar'

9.2 Class DefaultArg

9.3 Class Solutions

9.3.1 Class Variables

Name	Description
Sqlite3	Value: 0

9.4 Class FileDict

object —
 pycosmicstar.filedict__old.FileDict

A dictionary that stores its data persistantly in a file

9.4.1 Methods

```
__init__(self, solution=0, **options)
```

x.`__init__`(...) initializes x; see `help(type(x))` for signature

Overrides: object.`__init__` `exitit`(inherited documentation)

```
get(self, key, default=None)
```

```
__getitem__(self, key)
```

<code>__setitem__(self, key, value)</code>
<code>__delitem__(self, key)</code>
<code>update(self, d)</code>
<code>pop(self, key, default=<class pycosmicstar.filedict_old.DefaultArg at 0x7f5e62b4...>)</code>
<code>keys(self)</code>
<code>values(self)</code>
<code>items(self)</code>
<code>iterkeys(self)</code>
<code>itervalues(self)</code>
<code>iteritems(self)</code>
<code>has_key(self, key)</code>
<code>__contains__(self, key)</code>
<code>__len__(self)</code>
<code>__del__(self)</code>

Inherited from object

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`,
`__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`,
`__str__()`, `__subclasshook__()`

9.4.2 Properties

pycosmicstar.cosmology.cosmology └─
                                     pycosmicstar.lcdmcosmology.lcdmcosmology
The Cold Dark Matter (CDM) plus Cosmological Constant (Lambda) - lcdm

```

```
omegam -- (default 0.24) - The dark matter parameter

omegab -- (default 0.04) - The barionic parameter

omegal -- (default 0.73) - The dark energy parameter

h -- (default 0.7) - The h of the Hubble constant ( $H = h * 100$ )
```

__init__ (<i>self</i> , <i>omegam</i> =0.24, <i>omegab</i> =0.04, <i>omegal</i> =0.73, <i>h</i> =0.7)
dt_dz (<i>self</i> , <i>z</i>) Return the relation between the cosmic time and the redshift Overrides: <code>pycosmicstar.cosmology.cosmology.dt_dz</code> <code>exitit</code> (inherited documentation)
dr_dz (<i>self</i> , <i>z</i>) Return the comove-radii Overrides: <code>pycosmicstar.cosmology.cosmology.dr_dz</code> <code>exitit</code> (inherited documentation)
H (<i>self</i> , <i>z</i>) Return the Hubble parameter as a function of <i>z</i> . Keyword arguments: <i>z</i> -- redshift Overrides: <code>pycosmicstar.cosmology.cosmology.H</code>

dV_dz(*self*, *z*)

Return the comove volume variation.

Keyword arguments:

z -- redshift

Overrides: `pycosmicstar.cosmology.cosmology.dV_dz`

dgrowth_dt(*self*, *z*)

Return the derivative of the growth function with respect to time.

Keyword arguments:

z -- redshift

Overrides: `pycosmicstar.cosmology.cosmology.dgrowth_dt`

growthFunction(*self*, *z*)

Return the growth function

Keyword arguments:

z -- redshift

Overrides: `pycosmicstar.cosmology.cosmology.growthFunction`

sigma(*self*, *kmass*)

Return the sigma.

Keyword arguments:

kmass -- mass scale

Overrides: `pycosmicstar.cosmology.cosmology.sigma`

dsigma2_dk(*self*, *kl*)

"Return the integrating of sigma(M,z) for a top-hat filtering. In $z = 0$ return `sigma_8`, for $z > 0$ return `sigma(M,z)`

Overrides: `pycosmicstar.cosmology.cosmology.dsigma2_dk`

rodm(*self*, *z*)

Return the dark matter density

Keyword arguments:

z -- redshift

Overrides: *pycosmicstar.cosmology.cosmology.rodm*

robr(*self*, *z*)

Return the barionic density.

Keyword arguments:

z -- redshift

Overrides: *pycosmicstar.cosmology.cosmology.robr*

age(*self*, *z*)

Return the age of the Universe for some redshift.

Keyword arguments:

z -- redshift

Overrides: *pycosmicstar.cosmology.cosmology.age*

setCosmologicalParameter(*self*, *omegam*, *omegab*, *omegal*, *h*)

Set the cosmological parameters

Overrides: *pycosmicstar.cosmology.cosmology.setCosmologicalParameter*

getCosmologicalParameter(*self*)

Return the cosmological parameter

Overrides: *pycosmicstar.cosmology.cosmology.getCosmologicalParameter*

getDeltaC(*self*)

Return the critical density

getTilt(*self*)

Overrides: *pycosmicstar.cosmology.cosmology.getTilt*

getRobr0(*self*)

Return the barionic matter density at the present day.

Overrides: `pycosmicstar.cosmology.cosmology.getRobr0`

getRodm0(*self*)

Return the dark matter density at the present day.

Overrides: `pycosmicstar.cosmology.cosmology.getRodm0`

11 Module `pycosmicstar.observationalCSFR`

Version: 1.0.1

Author: Eduardo dos Santos Pereira

License: GPLv3

Value: <code>'Stable'</code>
<code>__package__</code>	Value: <code>None</code>

11.2 Class `ObservationalCSFR`

11.2.1 Methods

<code>__init__(self)</code>

csfredshift (<i>self</i>)
Return the redshift and the CSFR from observational data

errorData (<i>self</i>)
Return the asymmetric errors in the redshif and CSFR respectively

12 Module `pycosmicstar.parallellistcompreension`

12.1 Functions

<code>pool_map_seq(func, iterable, chunksize=None, njobs=None)</code>

<code>pool_zipped_map_seq(func, iterable, chunksize=None, njobs=None)</code>
--

<code>pool_sequentialize(iterable, njobs=None)</code>

<code>pool_map(func, iterable, chunksize=None, njobs=None)</code>

func must be an unary function

<code>pool_zipped_map(func, iterable, chunksize=None, njobs=None)</code>
--

func can be of variable arity and each element in iterable should be a tuple of the same length as func's arity

<code>pool_parallelize(iterable, njobs=None)</code>

<code>delayed(func)</code>

<code>parallelized(func)</code>

12.2 Variables

Name	Description

Name	Description
<code>__status__</code>	<p>Cosmological Dark Halos History From the formalism of Reed et al (MNRAS, 346, 565-572, 2003) it is calculated the mass fraction of dark matter halos. The code obtain the mass density of dark halos and the fraction of brions into structures as a function of the time. Here is used the Transfer function from Efstathiou, Bond & White – (MNRAS, 258, 1P, 1992). The current version it is assumed the normalization of WMAP (withou gravitational waves) adapted from Eisenstein e Hu (ApJ 511, 5, 1999) that in the way that return <code>sigma_8 = 0,84</code>. The fraction of mass of dark halos is obtained by the work of Sheth e Tormen (MNRAS 308, 119, 1999). All models consider $\Omega_{\text{Total}} = \Omega_{\text{M}} + \Omega_{\text{L}} = 1,0$ This file is part of pystar. copyright : Eduardo dos Santos Pereira</p> <p>pystar is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License. pystar is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. 16.2 Class structures

`pycosmicstar.structuresabstract.structuresabstract` └─ `pycosmicstar.structures.structures`

Known Subclasses: `pycosmicstar.cosmicstarformation.cosmicstarformation`

This class was constructed based in the like Press-Schechter formalism that provides characteristics like numerical density of dark matter halos into the range `m_h`, `m_h + dm_h`, the fraction of barionic matter, and, the accretion rate of barions into structures and the total number of dark halos.

The models used to develop this class was presented for the first time in the article of Pereira and Miranda (2010) - (MNRAS, 401, 1924, 2010).

The cosmologic background model is passed as a instance parameter:
`cosmology`

Keyword arguments:

`lmin` -- (default 6.0) log10 of the minimal mass of the dark halo where it is possible to have star formation.

`zmax` -- (default 20.0) - the maximum redshift to be considered

`omegam` -- (default 0.24) - The dark matter parameter

`omegab` -- (default 0.04) - The barionic parameter

`omegal` -- (default 0.73) - The dark energy parameter

`h` -- (default 0.7) - The `h` of the Hubble constant ($H = h * 100$)

`massFunctionType`:

(Dark Haloes Mass Function)

default 'ST' - Sheth et al. (2001) - $z=[0,2]$

'TK' - Tinker et al. (2008) - $z=[0,2.5]$

'PS' - Press and Schechter (1974) - $z=-$

'JK' - Jenkins et al. (2001) $z=[0,5]$

'W' - Warren et al. (2006) $z=0$

'WT1' - Watson et al. (2013) - Tinker Modified - $z=[0,30]$

'WT2' - Watson et al. (2013) - Gamma times times Tinker Modified
 $z=[0,30]$

'B' - Burr Distribution. Marassi and Lima (2006) - Press Schechter modified.

`qBurr`:

(default 1) - The `q` value of Burr Distribution.

16.2.1 Methods

`__init__(self, cosmology, **kwargs)`

`abt(self, a)`

Return the accretion rate of barionic matter, as a function of scala factor, into strutures.

Keyword arguments:

 a -- scala factor ($1.0 / (1.0 + z)$)

Overrides: `pycosmicstar.structuresabstract.structuresabstract.abt`

`fbstruc(self, z)`

Return the faction of barions into structures

Keyword arguments:

 z -- redshift

Overrides: `pycosmicstar.structuresabstract.structuresabstract.fbstruc`

`fstm(self, lm)`

Numerical function that return the value of `sigm` that will be used by `dfridr` to calculate `d_sigma_dlog10(m)`.

Keyword arguments:

 lm -- log10 of the mass of dark halo

Overrides: `pycosmicstar.structuresabstract.structuresabstract.fstm`

`getCacheDir(self)`

Return True and cache name if the cache directory existe and false else.

Overrides: `pycosmicstar.structuresabstract.structuresabstract.getCacheDir`

`getDeltaHTinker(self)`

`getmassFunctionDict(self)`

Return a list with key and function of implemented dark haloes mass function

halos_n(*self*, *z*)

Return the integral of the mass function of dark halos multiplied by mass in the range of log(M_min) a log(M_max)

Keyword arguments:

z -- redshift

Overrides: *pycosmicstar.structuresabstract.structuresabstract.halos_n*

massFunction(*self*, *lm*, *z*)

Return the mass function of dark halos.

Keyword arguments:

lm -- log10 of the mass of the dark halo

z -- redshift

Overrides: *pycosmicstar.structuresabstract.structuresabstract.massFunction*

numerical_density_halos(*self*, *z*)

Return the numerical density of dark halos within the comove volume

Keyword arguments:

z -- redshift

Overrides:

pycosmicstar.structuresabstract.structuresabstract.numerical_density_halos

setDeltaHTinker(*self*, *delta_halo*)

setMassFunctionDict(*self*, *key*, *function*)

Add a new key and function in the dark haloes mass function dictionary

setQBurrFunction(*self*, *q*)

Set the *q* value of dark haloes mass function derived from Burr distribuction.

*Inherited from **pycosmicstar.structuresabstract.structuresabstract**(Section 17.2)*

cosmicStarFormationRate(), *gasDensityInStructures()*

17.2 Class `structuresabstract`

Known Subclasses: `pycosmicstar.structures.structures`

17.2.1 Methods

massFunction (<i>self</i> , <i>lm</i> , <i>z</i>)
--

Return the mass function of dark halos
--

fstm (<i>self</i> , <i>lm</i>)

Numerical function that return the value of <i>sigm</i> that will be used by <i>dfridr</i> to calculate <i>d_sigma_dlog10(m)</i> .
--

halos_n (<i>self</i> , <i>z</i>)

Return the integral of the mass function of dark halos multiplied by mass in the range of <i>log(M_min)</i> a <i>log(M_max)</i>

fbstruc (<i>self</i> , <i>z</i>)

Return the faction of barions into structures

numerical_density_halos (<i>self</i> , <i>z</i>)

Return the numerial density of dark halos within the comove volume
--

abt (<i>self</i> , <i>a</i>)

Return the accretion rate of barionic matter into strutures

cosmicStarFormationRate (<i>self</i> , <i>z</i>)

gasDensityInStructures (<i>self</i> , <i>z</i>)
--

getCacheDir (<i>self</i>)

Return True if the cache directory existe and false else.
